

Análise de Métodos de Adaptive Thresholding

Christopher Akira França Maekawa

Introdução

- Adaptive Thresholding.
 - Global Threshold.
 - O que é Adaptive Threshold???
 - Motivo.
 - Métodos.

Adaptative Threshold

Aplicações

- Detecção de Objetos em Cenários Complexos.
- Processamento de Documentos e OCR.
- Análise Médica e Biomédica.
- Visão Computacional e Robótica

Método Matlab (adaptthresh)

```
function img_output = matlab_adaptive_threshold(input_image, threshold_sensitivity, statistic_mode, num_iter)
    total_time = 0;
    for i = 1:num_iter
        tic;
        img_output = adaptthresh(input_image, threshold_sensitivity, 'Statistic', statistic_mode);
        img_output = imbinarize(input_image, img_output);
        total_time = total_time + toc;
    end
    avg_time = total_time / num_iter;
    fprintf('Tempo médio de execução (%s): %.6f s\n', statistic_mode, avg_time);
    fprintf('Tempo médio de execução (%s): %.6f ms\n', statistic_mode, avg_time*1000);
end
```

0.0 - 1.0

- mean
- median
- gaussian

Método Matlab (adaptthresh)

Imagem original

Método Matlab mean

Imagem original

Método Matlab mean

Método Matlab median

Método Matlab gaussian

Método Matlab median

Método Matlab gaussian

Método Wellner

- Funcionamento.
- Pontos positivos:
 - Rápido.
 - Percorre a imagem apenas uma vez.
- Pontos negativos:
 - Ordem da varredura altera o resultado.
 - Não ótimo para mudanças sutis na iluminação.

Método Wellner

Imagem original

Método Wellner

Imagem original

Método Wellner

Método Wellner com Imagens Integrais

- Diferenciação do método Wellner.
- Pontos positivos:
 - Melhor sensibilidade a variação de contraste.
 - Independente da ordem de varredura.
 - Rápido.
- Pontos negativos:
 - Mais complexo do que o método Wellner.
 - Varre a imagem duas vezes.

Imagens Integrais

4	1	2	2
0	4	1	3
3	1	0	4
2	1	3	2

4	5	7	9
4	9	12	17
7	13	16	25
9	16	22	33

```

for i = 1:cols
    sum_col = 0;
    for j = 1:rows
        sum_col = sum_col + input_image(j, i);
        if i == 1
            intImg(j, i) = sum_col;
        else
            intImg(j, i) = intImg(j, i - 1) + sum_col;
        end
    end
end

```

```

for i = 1:cols
    for j = 1:rows
        % Definir coordenadas da janela
        x1 = max(i - half_s, 1);
        x2 = min(i + half_s, cols);
        y1 = max(j - half_s, 1);
        y2 = min(j + half_s, rows);

        % Número de pixels na janela
        count = (x2 - x1 + 1) * (y2 - y1 + 1);

        % Calcular a soma na janela usando imagem integral
        sum_window = intImg(y2, x2);
        if x1 > 1
            sum_window = sum_window - intImg(y2, x1 - 1);
        end
        if y1 > 1
            sum_window = sum_window - intImg(y1 - 1, x2);
        end
    end
end

```

Comparativo de velocidade

- Média de 50 execuções
- Tic Toc.

```
function img_output = matlab_adaptive_threshold(input_image, threshold_sensitivity, statistic_mode, num_iter)
    total_time = 0;
    for i = 1:num_iter
        tic;
        img_output = adaptthresh(input_image, threshold_sensitivity, 'Statistic', statistic_mode);
        img_output = imbinarize(input_image, img_output);
        total_time = total_time + toc;
    end
    avg_time = total_time / num_iter;
    fprintf('Tempo médio de execução (%s): %.6f s\n', statistic_mode, avg_time);
    fprintf('Tempo médio de execução (%s): %.6f ms\n', statistic_mode, avg_time*1000);
end
```

Conclusão

- Foi possível avaliar:
 - Aplicações do Adaptive Threshold.
 - Diferentes métodos de aplicação.
 - Eficiência do método Wellner.
 - Qualidade de imagem do método com imagem integral
 - Eficiência e qualidade do método utilizado pelo Matlab
